

# Assignment 8

EDH7916 | Spring 2020

Benjamin Skinner

This assignment is broken into two parts.

## **Review final project work to date**

Take a few minutes to see where you are with your project. Think about what you realistically would like to accomplish by the end of the term, keeping in mind the disruptions we've experienced so far as well as those that may be yet to come.

**Please email me with your project's status and your end of semester goal by EOD on Friday, 27 March 2020.**

## **BONUS**

If you have the time / energy, try to model your data in some way. Because everyone's project is different (and people are at different points in their quantitative course sequence), do what is appropriate for your situation:

1. If you plan to fit a t-test or regression model, try to do so now.
2. If you are using survey data, try using the survey package to compute properly weighted means and/or t-tests.

Push whatever you try in a file called `final_project_models.R` in your `final_project` folder by start of class next week.
